

worker_address

Synopsis

```
worker_address = address
```

Use dot notation in *address* to set the IP address you want the Worker to bind to. This is to override the behavior of binding to all addresses the Worker has assigned to it.

Note for Qube Worker hosts

This is a Worker startup parameter. Since this parameter is involved in the initial startup of the worker and affects the behavior of the worker before it contacts the supervisor to request a "remote" configuration from the central worker configuration file (see [qbwrk.conf](#)), it's considered a *bootstrapping* parameter and *can only be specified in the worker's local qb.conf* configuration file. Any mention in the global qbwrk.conf file will be ignored.

This is a complete list of the Worker bootstrap parameters

- [qb_directory](#)
- [qb_domain](#)
- [qb_supervisor](#)
- [worker_address](#)
- [worker_boot_delay](#)
- [worker_journal_location](#)
- [worker_lookup](#)
- [worker_max_threads](#)
- [worker_pidfile](#)
- [worker_port](#)

Example

```
worker_address = 127.0.0.1
```

Default

(all) (all IP addresses on this host)
