

supervisor_queue_library

Synopsis

```
supervisor_queue_library = type | file
```

The queue specifies the binary or script which defines the Supervisor's queuing algorithm. *type* specifies which queuing algorithm to use, or *file* points to a library file to be used as the source file for the queuing code.

Values

- cluster - Qube! clustering algorithm. Jobs run based on where in a hierarchical host "cluster" they are submitted.
- priority - Strict numeric priority. High priority jobs run before lower priority jobs.
- queue - First come-first served. Jobs run in the order in which they are submitted.

Examples

```
supervisor_queue_binding = Perl  
supervisor_queue_library = /usr/local/pfx/qube/qlib/stackQueue.pm
```

Defaults

Cluster
