

supervisor_max_postboard_retry

Synopsis

```
supervisor_max_postboard_retry = retries
```

Retries is the total number of attempts the Supervisor will make before giving up on communicating to "post" clients before giving up.

A "post"-style callback is set up for client programs (such as a GUI or a script) to "subscribe" to events. This requires that the client is listening on a port, and that the client acknowledge the receipt of events, which is where post comes in. Examples of use include the "waiton" option of `qbsub`, which uses the `qbwaitfor()` API call. `qbsubmitpost()` also submits a "post" callback.

Example

```
supervisor_max_postboard_retry = 16
```
