

supervisor_reserve_timeout

Synopsis

```
supervisor_reserve_timeout = timeout
```

The *timeout* value, in seconds, specifies how much time a job is allowed to hold a host in reserve before that job reports itself "running." If this timeout passes, the job is assumed to be a start failure and the host is released for use by other jobs.

Example

```
supervisor_reserve_timeout = 100
```

Defaults

600
