

# worker\_properties

## Synopsis

`worker_properties = propertylist`

This allows the administrator to specify/override the properties of a Worker. Worker properties can be used as a dispatch tool, i.e. "only send jobs to workers that have a host property of 'host.maya > 0'" by setting "host.maya>0" in the job's requirements.

## Example

```
worker_properties = "host.home_dir=/home,host.owner=dude,host.maya=1,host.nuke=1"
```

## Defaults

Internally, the following properties are stored:

- host.architecture
- host.cpus
- host.kernel\_version
- host.os
- host.processor\_speed
- host.proxy\_mode
- host.qube\_build
- host.qube\_class
- host.qube\_version
- host.worker\_mode

By default, there are no additional properties stored.
