

worker_boot_diagnostics_retries

Synopsis

`worker_boot_diagnostics_retries = retries`

Number of times the worker should retry its boot-time diagnostic tests (check the `worker_logpath` permissions, the existence of proxy program at `proxy_location`, and the validity of the `proxy_account`) when there are errors, before giving up and going into the "panic" state.

Example

`worker_boot_diagnostics_retries = 5`

Defaults

1
