

# worker\_flags

## Synopsis

```
worker_flags = flag[,flag...]
```

Set global Worker configuration flags.

## Values

Name	Description
dedicated	Denotes if the host is a dedicated Qube Worker. (This flag is obsolete and no longer carries any meaning)
dynamic	Notify the Supervisor that it should identify the Worker by its hostname rather than its ip address. This allows the Supervisor to migrate host information rather than create a new host with the same name.
auto_mount	Enables the Windows Auto-Mounting system. The Worker will automatically mount drives which were detected in the user's environment any time the <code>auto_mount</code> job flag is set. (Windows only)
remove_logs	The Worker will automatically remove any logs which it used as temporary storage while running a job. Should only be disabled for debugging purposes.
load_profile	The Worker will use the Windows profile when running the job. (Windows only)
auto_remove	Automatically remove the worker from the supervisor's list of hosts when the worker service is stopped.

## Example

```
worker_flags = "auto_mount,load_profile,auto_remove"
```

## Defaults

- Linux & OS X: "remove\_logs"
- Windows: "remove\_logs,load\_profile,auto\_mount"
