Local Worker Configuration

All Worker parameters can be configured locally in the Worker's **qb.conf** file. These parameters can be specified by either one of two ways:

- From the QubeGUI under "Administration->Configure (local)…". This will modify the qb.conf for the user and then prompt the Worker service to restart automatically.
- Manually modify the **qb.conf** directly and then restarting the Worker service

The following parameters are only settable locally on the Worker as they determine where the Qube installation is located, the hostname of the Supervisor, and the filtering field for network communication.

- qb_directory
- qb_domain
- qb_supervisor
- worker_address
- worker_boot_delay
- worker_journal_location
- worker_lookup
- worker_pidfile
- worker_port
