Qube Job Environment

Cwd

Key	Value

Environment Variables

Impersonate User

✓ [Click here for details...](#)

## Cwd

Current Working Directory to use when running the job.

## Environment Variables

Environment variables override when running a job. You can specify key/value pairs of environment variables

This is useful when you might need different settings for your render applications based on different departments or projects.

## Impersonate User

You can specify which user you would like to submit the job as. The default is the current user. The format is simply <username>. This is useful for troubleshooting a job that may fail if sent from a specific user.

Example:

Setting "josh" would attempt to submit the job as the user "josh" regardless of your current user ID.

Note: In order to do this, the submitting user must have "impersonate user" permissions.
